

ABSTRACT OF THE DISCLOSURE

On a transmitter side, an enciphering means enciphers
a plaintext code according to stream enciphering method having
5 a feature in selecting the cycle of a PN signal and then a
transmitting means transmits the cryptographic code. On the
other hand, on a receiver side, a deciphering means restores
the cryptographic code enciphered in the above described
procedure to an original plaintext code by carrying out
10 exclusive-OR operations again.
